Class Topper Finder

Coding Assignment - Problem 1 | Python

```
Task: Return (rowIndex, total) for the student with highest total marks.
Ties must choose the smallest row index. Update only when a sum is strictly greater.
def findTopper(marks):
best_index, best_total = 0, -1
for i, row in enumerate(marks):
total = sum(row)
if total > best_total:
best_index, best_total = i, total
return (best_index, best_total)

marks = [[78, 85, 90], [88, 92, 79], [65, 70, 95]]
print(findTopper(marks))

Output: (1, 259)
Complexity: O(m*n) time, where m is students and n subjects.
Extra space: O(1), excluding the input grid and returned tuple.
```
