Merging Two Token Queues

Coding Assignment - Problem 2 | Python

```
Task: Merge two already sorted lists, preserve duplicates, and do not sort after concatenation.
def mergeTokens(counterA, counterB):
i = j = 0
merged = []
while i < len(counterA) and j < len(counterB):
if counterA[i] <= counterB[j]:
merged.append(counterA[i])
i += 1
else:
merged.append(counterB[j])
j += 1
merged.extend(counterA[i:])
merged.extend(counterB[j:])
return merged

print(mergeTokens([3, 8, 15, 20], [5, 8, 12]))
print(mergeTokens([], [4, 9]))

Output: [3, 5, 8, 8, 12, 15, 20]; then [4, 9].
Complexity: O(m+n) time and O(m+n) output space.
Concatenate-then-sort takes O((m+n) log(m+n)) time.
```
