Ticket Price Slot Finder

Coding Assignment - Problem 5 | Python

```
Task: Return the existing index for newPrice or its sorted insertion position.
def findSlot(prices, newPrice):
low, high = 0, len(prices)
while low < high:
mid = (low + high) // 2
if prices[mid] < newPrice:
low = mid + 1
else:
high = mid
return low

prices = [120, 150, 200, 260]
print(findSlot(prices, 150))
print(findSlot(prices, 210))
print(findSlot(prices, 300))

Output: 1, 3, 4
Complexity: linear scan O(n) time; binary search O(log n) time.
Both use O(1) additional space.
```
