Warehouse Grid Summary

Practice Part A - Problem 2 | Python

```
Task: Return (total_items, max_coordinate). Row-major scanning breaks ties by the first cell.
def warehouseSummary(grid):
total, max_value = 0, -1
max_coordinate = (0, 0)
for r, row in enumerate(grid):
for c, value in enumerate(row):
total += value
if value > max_value:
max_value, max_coordinate = value, (r, c)
return (total, max_coordinate)

grid = [[4,9,2], [7,1,6], [3,12,5]]
print(warehouseSummary(grid))

Output: (49, (2, 1))
Complexity: O(m*n) time and O(1) auxiliary space.
```
