Pair With Target Sum (Unsorted Array)

Practice Part A - Problem 4 | Python

```
The source repeats the target-sum task as a separate problem; this solution follows that version.
def hasPairWithSum(nums, target):
seen = set()
for value in nums:
complement = target - value
if complement in seen:
return True
seen.add(value)
return False

print(hasPairWithSum([2,7,11,15], 9))
print(hasPairWithSum([3,4,6], 20))
print(hasPairWithSum([3,3], 6))

Output: True, False, True.
Two nested loops: O(n^2) time and O(1) extra space.
Hash-set method: average O(n) time and O(n) extra space.
```
